1. Introduction

In today's fast-moving world, transportation plays an important role in daily life — whether people are booking vehicles for travel or sending packages from one place to another. But many transport companies still use manual systems or basic spreadsheets, which often lead to mistakes, delays, and lost information.

To solve this problem, we decided to build a **Transport Management System (Tranzzy)** using Java. It includes a simple interface, using a database to store information, and help users easily **book tours** or **send couriers** without hassle.

2. Problem Statement

Manual Bookings: Many transport companies face problems because they still manage bookings and deliveries manually. This often causes booking mix-ups, delivery mistakes, and repeated records.

Dynamic Fare Calculation Based on Distance and Facilities : Most traditional systems use fixed charges for routes, which do not account for variables like distance, traffic conditions, vehicle type, fuel costs, or peak-hour demand. This leads to either overcharging or undercharging, resulting in customer dissatisfaction and revenue loss.

3. Methodology

We have developed this system in **Java**, using **object-oriented programming**. Here's how we'll build it:

1. Basic version using **IntelliJ IDEA**
2. Create a proper **Graphical User Interface (GUI)** using Java Swing
3. Connect it to a **MySQL database** to store booking and courier data

- **Key Modules:**

- User Panel:**

- Book a Tour
 - Send Courier
 - View past bookings and parcel records.

- Admin Panel:**

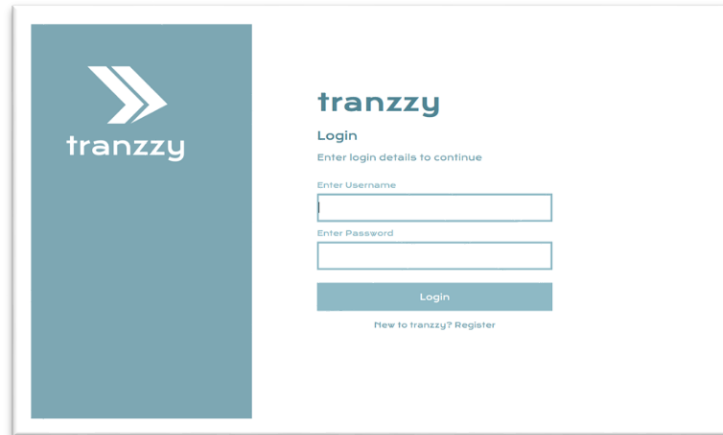

- View all bookings and parcel records
 - Delete records

4. Major Outcomes

- A working desktop app using Java
 - Smooth handling of bookings and courier requests
 - Easy-to-use interface for both users and admins
 - A system that's well-organized and easy to upgrade in the future
 - Practical use of programming in real-life problems
-

5. Implementation

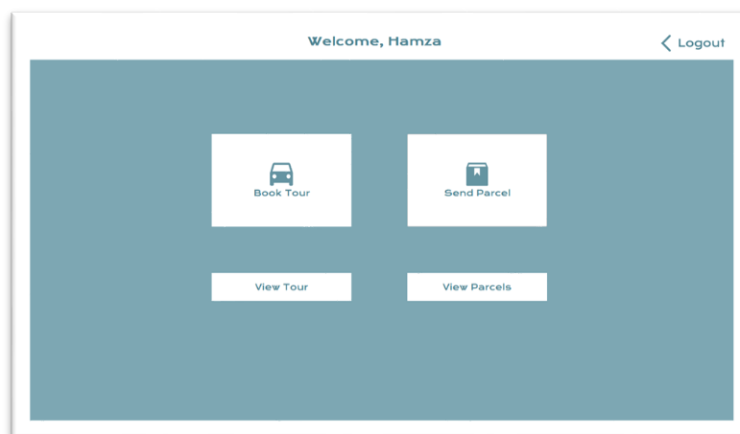

- Login Screen

The login screen features a teal sidebar on the left with the Tranzzy logo. The main content area is white and contains the following elements:

- tranzzy** logo
- Login** heading
- Subtext: Enter login details to continue
- Form fields:
 - Enter Username
 - Enter Password
- Login** button
- Link: New to tranzzy? Register

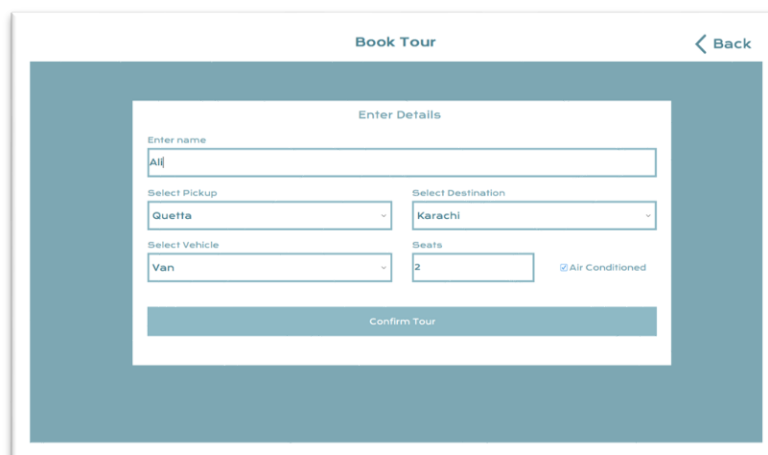

- Main Menu

The main menu is displayed on a teal background. At the top, it says "Welcome, Hamza" and has a "Logout" link. The menu consists of four white buttons arranged in a 2x2 grid:

- Book Tour** (with a car icon)
- Send Parcel** (with a box icon)
- View Tour**
- View Parcels**

- Book Tour

The "Book Tour" screen has a teal background and a "Back" link. It contains a white form titled "Enter Details" with the following fields:

- Enter name:
- Select Pickup:
- Select Destination:
- Select Vehicle:
- Seats:
- ☒ Air Conditioned
- Confirm Tour** button

- Tour History

6. Conclusion

Our **Transport Management System (Tranzzy)** shows how coding can solve real-world problems. It helps reduce manual work, avoids errors, and makes transport services more reliable.

By building this project, we've improved our Java programming skills and learned how to develop real software, from design to testing to presentation. This project also helped us practice teamwork, time management, and problem solving.
